

Zapify Designs

WEBSITE SETUP BOOKLET

A simple step-by-step guide to getting your new website online.

1. What you received

Your download contains your website files plus this booklet. Keep the entire ZIP together until you have uploaded the website to your chosen hosting service.

2. Create a GitHub account

Go to GitHub and create an account if you do not already have one. After signing in, choose New repository. Give the repository a clear name such as my-business-website. For a public GitHub Pages website, select Public. You can leave the other settings at their defaults.

3. Create your repository

Open the new repository and choose Add file → Upload files. Unzip your Zapify website on your computer first, then upload the website files and folders. Make sure index.html is in the main/root level of the repository, not hidden inside another folder.

4. Turn on GitHub Pages

In your repository open Settings → Pages. Under Build and deployment, choose Deploy from a branch. Select the main branch and the /(root) folder, then save. GitHub will provide a Pages URL once the site has deployed. It can take a few minutes for the first deployment.

5. Connect your domain

If you own a domain, open the domain provider DNS manager. For a GitHub Pages setup, GitHub will show the DNS records it expects for your repository. Follow the current records shown by GitHub rather than copying old records from another website. Add the required A/AAAA or CNAME records at your domain provider, then add the custom domain inside GitHub Pages.

6. Afrihost domain setup

If your domain is managed through Afrihost, sign in to the Afrihost client area and open the domain's DNS/Zone Editor. Add the DNS records supplied by GitHub Pages. Remove conflicting records only when you are sure they belong to the old website. DNS changes can take time to propagate.

7. Check your live website

Open your GitHub Pages URL or custom domain. Test the navigation, buttons, forms, images, mobile layout and any WhatsApp/contact links. If the domain shows a security warning while DNS is updating, wait for the SSL certificate to finish provisioning.

8. Need help?

Zapify Designs includes free support for setup questions related to your purchased template. If something is wrong with the supplied template, contact Zapify Designs for support. If you believe you are eligible for a refund, contact Zapify Designs before attempting to alter or redistribute the template.
